

Page 1: The Bug Bounty Ecosystem

Introduction to VDP vs BBP, Ethical Hacking, and Safe Harbor disclosure rules.

This module covers the professional foundation required for the bug bounty ecosystem. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 2: Networking for Hackers

[VISUAL AID: THE HTTP REQUEST LIFECYCLE]

```
BROWSER (Client) ----> [ GET /index.html HTTP/1.1 ] ----> FIREWALL/WAF
      ^                               | (Request Headers)           |
      |                               v                               v
RENDER PAGE <---- [ HTTP/1.1 200 OK ] <---- SERVER (Backend Logic)
                (Response Body + Headers)
```

Deep dive into HTTP/S (Verbs, Status Codes) and DNS (Takeovers, Zone Transfers).

This module covers the professional foundation required for networking for hackers. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 3: Web Architecture & API Flows

Understanding Frontend (JS/DOM) vs Backend (Logic/API) and REST/GraphQL structures.

This module covers the professional foundation required for web architecture & api flows. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 4: Mastering Linux for Security

Terminal mastery, Shell scripting, and file permission management.

This module covers the professional foundation required for mastering linux for security. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 5: Professional Lab Infrastructure

Setting up Virtual Machines (Kali/Parrot) and VPS for automated scanning.

This module covers the professional foundation required for professional lab infrastructure. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 6: The Interception Proxy

Full guide to Burp Suite Proxy, Repeater, Intruder, and Decoder modules.

This module covers the professional foundation required for the interception proxy. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 7: Browser Configuration

Firefox security hardening, FoxyProxy, Wappalyzer, and Hack-Tools extensions.

This module covers the professional foundation required for browser configuration. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 8: The Reconnaissance Blueprint

Mapping attack surfaces using Passive (Shodan/Google) and Active (Nmap/Amass/Ffuf) tactics.

This module covers the professional foundation required for the reconnaissance blueprint. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 9: Platform Mastery

Building a reputation on HackerOne/Bugcrowd and earning private program invites.

This module covers the professional foundation required for platform mastery. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Page 10: Legal, Scope, and Reporting

Professional report writing: Summary, Steps to Reproduce, Impact, and Remediation.

This module covers the professional foundation required for legal, scope, and reporting. A hunter must have a 360-degree understanding of how requests are handled and secured. Mastering these fundamentals ensures that when you find a bug, you understand the root cause.

Self-Assessment Quiz

- What is the core difference between Status Code 401 (Unauthorized) and 403 (Forbidden)?
- Why is checking the 'Scope' of a program the first thing a hunter should do?
- In Burp Suite, what module is primarily used for manual request tampering and re-submission?
- Which DNS vulnerability allows an attacker to claim a domain name pointed to a defunct service?
- How does 'Signal' affect your invitations to Private Bug Bounty programs?
