

Introduction: The Power of Ethical Hacking

Welcome to the world of Bug Bounties. In an era where data is the new oil, Cybersecurity has become the ultimate shield.

- What is Ethical Hacking? It is the art of thinking like a criminal to protect the innocent.
- Why Bug Bounties? Companies like Google, Meta, and fintech giants pay thousands of dollars to independent researchers who find security flaws before the 'Bad Guys' do.

This industry is not just about tools; it is about the Hunter's Mindset.

The Hunter's Logic: Systematic Approach

A common mistake beginners make is jumping blindly into hacking. A professional 'Hunter' follows a strict methodology:

1. Scope Definition: Knowing exactly what is allowed to be tested.
2. Reconnaissance: Mapping the enemy's digital footprint.
3. Vulnerability Analysis: Finding the weak link in the chain.
4. Exploitation: Proving the bug exists with a Proof of Concept (PoC).
5. Reporting: Communicating the risk to the company clearly.

Recon Essentials: Mapping the Surface

Recon (Reconnaissance) is 70% of the job. If you find a hidden 'Subdomain' that no one else has tested, you are likely to find a bug.

- Tools for Beginners:

- * Subfinder: For discovering subdomains like 'dev.target.com'.
- * Nmap: For scanning open ports and identifying services (HTTP, SSH, MySQL).
- * HTTPX: To check which subdomains are alive and responding.

Anatomy of a Bug: Information Disclosure

Let us look at a real-world example: Information Disclosure.

Imagine a developer leaves a file named '.env' or 'config.php.bak' on the public server.

- Point of Failure: Misconfigured web server permissions.
- Practical Step: Accessing 'https://target.com/.env' might reveal Database Passwords or API Keys.
- Result: A 'Low' to 'Medium' severity bug that build your reputation on platforms like HackerOne.

The Bridge to Mastery: Towards the Elite

You have taken the first step. But the world of security is deeper than simple leaks.

Real professional success comes from master techniques:

- Chaining Vulnerabilities: Combining a small bug with another to create a 'Critical' impact.
- WAF Evasion: Bypassing sophisticated firewalls like Cloudflare.
- Root Cause Analysis: Understanding architectural failures at the source code level.

All these 'Elite' secrets are revealed in our most advanced curriculum:

COURSE 4: THE SOVEREIGN HUNTER.

Are you ready to stop being a beginner and start being a Sovereign Hunter?
